

Scala Media Player-L (B308)

- [Operating System](#)
- [Licensing](#)
- [Hardware Specifications](#)
- [Configuration](#)

The Scala Media Player-L is an affordable, entry-level digital media player that delivers stable and reliable performance in an ultra-compact design. The anodized aluminum housing and fanless design protect the Scala Media Player-L from dirt, dust, and debris that could compromise performance.

Pair the Scala Media Player-L with any of our feature-based licenses to add full device monitoring, playback of ScalaScript, and/or Campaign Management.

Operating System

Windows 10 IoT Enterprise 2016 LTSC

The operating system has minor customizations implemented by Scala to optimize performance.

Licensing

Recommended license: Single HD (Standard/SW-PST-HD01)

The Player-L pairs best with a single-channel [Standard HD license](#), which allows standard HD/1080p resolution while providing several more features than a Lite license.

While you can use a Lite license with this player, the Lite license imposes some feature limitations.

As the Player-L does not support 4K playback, an Advanced UHD license will provide you with additional features but it generally will not improve picture quality above that provided by a Lite or Standard HD license.

With only one HDMI video output, the Player-L should be paired only with single-channel licenses.

For details about the different licenses, refer to the [License Functionality Matrix](#).

Hardware Specifications

Refer to <https://www.scala.com/en/products/hardware/scala-media-player-l/>.

Configuration

Setting up and configuring the SMP-L player requires you to first create a player profile in Content Manager. See [Creating a Player](#) in the Content Manager help for more information.

This section also covers additional specifications and system functions, including configuration instructions for the Windows Operating System and the Scala Windows Player:
